Assessment Specification Guide .....	17

## Introduction

The methodology adopted by BigMint is designed to deliver price assessments that accurately and consistently reflect the market value of commodities. Aligned with global IOSCO Principles for Price Reporting Agencies (PRAs), it provides a transparent, accountable, and systematic framework for price reporting.

In this context, “assessment” refers to the price of a specific commodity, defined by its grades, specifications, and the designated market location.

We use the term index in certain assessments to refer to the price of a key commodity in a specific region, which serves as a benchmark for evaluating market trends and determining the value of similar commodities within that market.

The price assessments are conducted by our analysts, who actively gather market data from knowledgeable market participants.

Through this document, our objective is to establish standardized practices for evaluating various commodities, ensuring consistency among our analysts. This approach aims to uphold the integrity of our price assessments and foster trust among stakeholders.

### How this methodology statement is organized

This description of methodology for assessments is divided into seven major parts (1-7) that parallel the process of producing price assessments.

- **Part 1** delves into the concept of methodology, outlining its purpose and the benefits it offers to various industries. This section also underscores the criteria used to design methodology, while providing an overview of the process involved.
- **Part 2** discusses the significance of market study, outlining

why they are crucial, and explores the diverse range of analytical tools utilized for conducting comprehensive market analyses.

- **Part 3** provides an overview of how BigMint collects market data, validates it, and uses it to formulate price assessments. It explains the methods used to handle anomalies, normalize data, and apply judgment in the process. It also outlines the checks and approvals conducted to verify the accuracy of price assessments, as well as the defined publication schedule and process for corrections.
- **Part 4** presents a schematic diagram outlining the entire process of developing price assessments, highlighting the various conditions encountered, along with additional process flowcharts.
- **Part 5** outlines the established practices adhered to according to the principles set forth by IOSCO.
- **Part 6** details the standard procedures for implementing changes to the methodology and approval process, and provides a comprehensive record of these modifications.
- **Part 7** provides an exhaustive list of benchmarks, delineating their attributes and publication schedules within the scope of BigMint's price reporting portfolio.

## 1. Methodology Overview

This section offers a structured understanding of the methodology applied in price assessments. It outlines the purpose and significance of the framework, highlights the criteria used in its development, and explains its relevance

for businesses. The overview also includes a consolidated flow chart that maps the key stages of the assessment process.

### 1.1 What is methodology

In the fast-paced world of global markets, accurate and reliable price assessments are crucial for informed decision-making among market participants. Methodology refers to the structured framework used to determine commodity prices based on defined procedures, data inputs, and evaluation criteria. It provides a clear and consistent approach that enables market dynamics to be captured systematically and reflected accurately in the final price computation.

### 1.2 Purpose of methodology

The primary purpose of the methodology is to capture relevant market dynamics and influencing factors, ensuring that prices published reflect prevailing market conditions. It provides a unified approach for conducting assessments, enabling comparability across commodities and markets. A well-defined methodology also enhances confidence among stakeholders by making the process transparent and easy to understand.

### 1.3 How methodology benefit businesses

A robust methodology supports businesses by offering dependable reference prices that guide commercial decisions in volatile markets. It enhances negotiation strength, supports risk management, and contributes to fair, well-informed transactions. Additionally, adherence to established methodologies ensures regulatory compliance, minimizing the risk of legal disputes.

### 1.4 Criteria for methodology development

The development of a methodology follows a structured approach aimed at ensuring that assessments reflect true market conditions.

This process incorporates insights from market surveys and

feedback from participants, helping to understand overall market behaviour, trading practices, data reliability, and liquidity conditions across markets. These inputs form the basis for establishing the criteria and defining a unified framework for price computation that remains applicable and effective for all commodities.

The rationale for adopting this methodology lies in its ability to capture market dynamics in a dependable and unbiased manner. Its development is guided by core principles, including transparency, consistency, objectivity, and market reflectiveness. This foundation ensure that assessments are grounded in credible information, applied through standardised procedures, and remain resilient under varying market conditions.

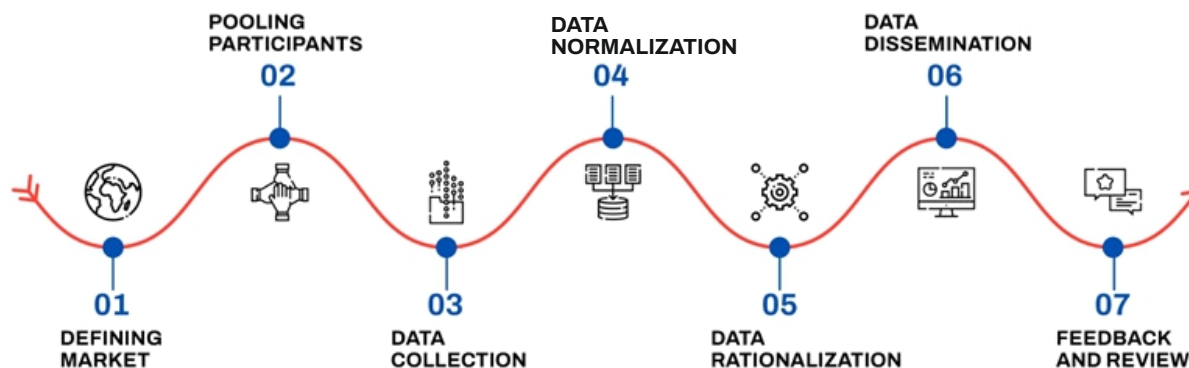

### 1.5 Methodology flow chart

Defining the methodology for price assessment involves a systematic process to ensure clarity, accuracy, and reliability. It begins with a thorough study to understand the market, followed by the collection of market data from a wide cross-section of participants.

Once collected, the data is organized and analyzed using Bigmint's rigorous, rationale-based computation model to determine the final price.

The assessed prices are then published and made available for stakeholders, supported by a structured feedback mechanism that helps maintain the relevance, accuracy, and transparency of the assessment process.

The overall methodology comprises seven primary stages, as summarized in the process flow diagram. Detailed explanations of each stage are provided in the preceding sections of this report.

## 2. Market Study

A market study for price assessment involves a comprehensive analysis of various factors influencing the pricing dynamics within a specific market or industry.

### 2.1 Purpose of market study

The market study serves as a solid foundation for conducting precise and informed price assessments. It entails analyzing crucial elements such as market size, demand-supply dynamics, historical and seasonal trends, competitive landscape, regulatory developments, and potential risk.

### 2.2 Data analytics tools

Certain market tools and analytical approaches play a pivotal role in understanding these dynamics, facilitating deeper insights into market behavior and trends. These include:

**Capacity:** It reflects the infrastructure, technology, and resources available for production. It also helps stakeholders understand the scalability and growth potential of industries or sectors within the market.

**Production:** Production data in a market study quantifies the real-time output of commodity within a defined period, offering insights into production efficiency, output trends, and the capacity to fulfill market demand. This information is crucial for businesses to optimize production schedules, maintain appropriate inventory levels, and swiftly adapt to fluctuations in demand.

**Consumption:** Consumption data in a market study monitors the utilization of commodities, analyzing patterns, trends, and factors influencing consumer behavior. This information is essential for businesses to comprehend market demand, predict future consumption patterns, optimize logistics, and customize marketing strategies to effectively target specific consumer segments.

**Export/Import:** Export and import data in a market study quantify the exchange of commodities between countries, encompassing trade volumes, values, tariffs, and the influence of trade agreements on market integration. It enables businesses to pinpoint potential trade markets, evaluate their competitive standing, and navigate regulatory complexities associated with international trade.

### 3. Price Assessment Mechanism

This section provides description of the methods utilized for gathering and processing market data to ensure the creation of reliable price assessments.

#### 3.1 Category of price assessments

Price assessments for various commodities are generally classified based on the nature of the transaction, delivery destination, and publication frequency, depending on the market being evaluated.

##### 3.1.1 Classification based on nature of transaction:

- **Spot:** This assessment involves the immediate exchange and delivery of a commodity at the current market price, typically occurring shortly after the transaction agreement is made.
- **Long-Term:** This assessment is defined for agreements where the price, terms, and delivery conditions are established for a transaction that will take place over a prolonged period.

The price could be fixed, or it may have terms for adjustment based on certain factors.

- **Future Transactions:** This assessment involve contracts for the delivery of commodity at a predetermined price, to be executed at a specified future date.

These contracts are typically standardized and traded on exchanges.

At BigMint, our price assessments are based on spot pricing, where transactions are settled immediately at the current market price.

##### 3.1.2 Classification based on destination of delivery:

- **Domestic Delivery:** Commodity traded within the borders of a single country.
- **Import Delivery:** Commodity brought into a country from abroad.
- **Export Delivery:** Commodity shipped out of a country to foreign markets.

##### 3.1.3 Classification based on publication frequency:

The frequency of assessments is determined based on market liquidity, volatility, the urgency of market activity, and other characteristics of the particular product.

- **Monthly assessment:** These are carried out once a month and provide a snapshot of the market price, reflecting longer-term trends.
- **Weekly assessment:** These assessments are carried out once a week and reflect trends and price movements observed during the trading week.
- **Bi-weekly assessment:** These are carried out twice within a week to show volatility on a broader level than weekly assessments.
- **Daily assessment:** These involve determining the market price of a commodity on a daily basis. For certain commodities, assessments are conducted multiple times a day to capture market volatility throughout trading hours.
- **Out of Schedule assessment:** This refers to conducting price assessments outside the regular schedule, usually due to market volatility, to capture real-time changes not reflected in standard assessments.

#### 3.2 Data collection

BigMint collects comprehensive, relevant, and verified data from market participants to ensure accurate assessments. The goal is to gather detailed transactional information, including quality, specifications, order sizes, dimensions, payment, and delivery details. This approach enables a thorough understanding of market dynamics for each commodity.

Our analysts continuously seek active participation from knowledgeable contributors to maintain the integrity of our price assessments.

##### 3.2.1 Who can report

BigMint proactively engages a broad range of market participants for each assessment. In addition, any participant with relevant, non-speculative information provided in good faith is encouraged to contribute.

Relevant employees directly involved in pricing, trading, sales & marketing functions or business heads at a company are identified as market participants through comprehensive market research or via references.

Upon assessing competence and understanding of the market, the participants are approved by the Manager and onboarded by completing the required KYC information. Once onboarded, the participant is informed that BigMint will engage with them for data collection and that their market inputs may be used in the assessment process.

BigMint is committed to continuously expanding its participant base to enhance the quality and reliability of its pricing process. Data received from individuals outside the designated participant list may be used in price computation only if it is relevant and thoroughly verified.

An exhaustive list of market participants includes:

- Manufacturers
- Buyers
- Sellers
- Traders
- Brokers
- Auction/Trading Platforms

Analysts ensure an appropriate mix of buyers, sellers, and traders in the data collection framework to support accurate, unbiased, and non-manipulative data capture.

### 3.2.2 How to report

BigMint accepts the most commonly used communication tools available for market participants to report their price information. Therefore, any means of reporting a price or useful information is accepted.

Various means of communicating information with BigMint include:

- Telephone
- Email
- Text messages
- Instant messaging platforms (WhatsApp/Skype)
- In person

### 3.2.3 What to report

As per the Data Submitter Policy, market participants are expected to provide accurate, complete, and representative market data in line with the criteria defined in the methodology. Participants are encouraged to submit all relevant forms of

market data, including but not limited to:

- Concluded deals
- Firm bids
- Firm offers
- Indicative bids and offers
- Tender/Auction results
- Freight rates

Participants are also encouraged to provide transaction data from both front-office and back-office functions, including inter-affiliated deals, to ensure completeness and accuracy. Additionally, they are responsible for validating and corroborating any information received from internal or external sources before submission.

In cases where a market participant submits a price range instead of a single value, the midpoint of the range is used as an input for the subsequent price assessment, unless prevailing market evidence indicates that one side of the range is more reflective of true market value. In such cases, the rationale for using the extreme value is documented for clarity and transparency.

The Data Submitter Policy further emphasizes the completeness of data across the following key parameters:

- **Laycan:** The BigMint price assessments incorporate loading and delivery schedules specific to each market evaluated.
- **Incoterms:** Delivery or loading locations must align with the assessment specification guide.
- **Quality:** Each assessment outlines precise quality standards and specifications as detailed in the specification

guide.

- **Quantity:** Refers to the volume or amount of the commodity being traded or evaluated.
- **Currency:** The currency used in the assessment is as per the customary trading practice for that commodity (e.g., USD, INR, RMB).
- **Unit of Measurement:** Must correspond to the prevailing trading unit in the market (e.g., metric tonne, kilogram, pound).
- **Payment Term:** Specifies the mode and timing of payment, typically either advance payment or credit terms within an agreed period.

Under no circumstances can a participant require that their data be used in the assessment. The decision to include or exclude any data always rests with the analyst. Any information submitted after the assessment timestamp will not be considered in the assessment process.

Analysts maintain a credibility ranking for each market participant based on interaction quality, consistency of submitted data, and verified participant identity. These rankings are periodically reviewed to ensure the reliability of data used in price assessments.

Participants found to be submitting incorrect or anomalous data—reflected through persistently low credibility scores—or those not in regular contact may be subject to review, and decisions regarding deboarding such participants are taken accordingly.

### 3.3 Data collection window

Data Collection Window refers to the specific time frame during which data is collected from market participants for the purpose of assessing and publishing prices. It is structured to cover the period of highest liquidity, when most trading activity occurs and market participants actively submit price information.

As a guiding principle, to ensure completeness and robustness of the assessment, all relevant and verifiable market data received up to the point of price publication may be considered for final computation, even if such data is received shortly after the defined data collection window.

Any data collected significantly outside the window, or after publication, is not considered in the assessment cycle.

Data collection windows for each assessment are different and are documented separately in the Price Assessment Specification Guide.

For out-of-schedule price assessments due to market volatility, the ideal data collection window must be short, responsive, and align with periods of heightened market activity. Clear communication with market participants is essential for transparency, and the collected data needs to be analyzed and assessed promptly to ensure an accurate reflection of volatility or anomalies.

### 3.4 Market data used

We include verified market data for computing the final price that are collected within the defined window, provided they meet the minimum quantity, delivery, timing, and specification requirements of the specific assessment. Any data that does not meet these criteria are not considered for price calculation.

Most data submitted by market participants are provided as absolute values, meaning they are transaction-based in the form of bids, offers, or trade deals.

In cases where inputs are submitted as spreads, or where values are derived through interpolation or extrapolation, these are clearly identified and appropriately marked in the data-collection module to ensure full transparency in the assessment process.

Analysts are trained to review and validate all submitted data, ensuring that the collected prices are transparent, reliable, and clearly executable by any potential market participant.

#### 3.4.1 Data validation

The analyst conducts a detailed validation of all submitted data to ensure its accuracy and representativeness. This process includes cross-checking with other market participants, comparing data against prevailing market trends, corroborating with additional market inputs (such as bids, offers, and indicative levels), and assessing the commercial rationale behind reported transactions.

Deals flagged by other market participants as potentially anomalous are also reviewed by the analyst and may be excluded if, after assessment, they are determined not to reflect true market value.

Additionally, where feasible, the analyst also seeks supporting evidence—such as transaction records or contract notes—to further verify the legitimacy and accuracy of the reported data.

#### 3.4.2 Hierarchy of information

The publication frequency is determined based on market liquidity and volatility. Accordingly, the data collection window for each assessment has been established.

All relevant market data captured within this window is given equal preference and is included in the hierarchy without any preferential weighting.

In cases where certain market data does not meet the

specified criteria for final computation, a normalization technique is applied to ensure alignment with the rest of the data-set.

### 3.5 Normalization

Normalization refers to the process of adjusting or standardizing market data to ensure it aligns with a specific set of criteria or standard definitions. This process evaluates the market data against the BigMint assessment specifications to ensure the final published assessment is fully representative.

Our analysts apply normalization techniques to non-standard data to align it with the established specification.

The normalization procedures are tailored to each commodity based on relevant parameters. These procedures are implemented in accordance with feedback received from market participants, and the normalized values are carefully recorded and documented for future reference.

Parameter	Description
Quantity	Adjust for trading volume differences to ensure transaction comparability.
Quality/ Specifications	Align products with similar quality/specifications for consistent price comparison.
Currency	Normalize prices by converting currencies to a common standard using exchange rates.
Unit of Measurement	Standardize units of measurement for consistency in quantity comparison across transactions.
Incoterms	Adjust based on delivery responsibility, factoring in costs, risks, and transportation duties.
Delivery Term	Update for location, shipping method, or transport cost changes to ensure accurate pricing.
Payment Term	Modify for variations in due dates, discounts, or currency fluctuations to reflect true cost.

### 3.6 Outliers & exclusions

Market data are excluded from a price assessment if they fall outside the defined collection window or do not meet the required criteria for quantity, delivery period, publication timing, or product specifications.

Data may also be excluded if they are identified as unreliable indicators of true market value. Examples include transactions between affiliated entities that are not conducted independently and are speculative in nature, data points that materially deviate from prevailing market conditions due to differing specifications, atypical delivery locations, or counterparties not commonly active in the market.

For all relevant and verified inputs that meet the assessment criteria, BigMint applies a uniform standard deviation-based statistical method to identify and eliminate outliers. This methodology is applied consistently across all forms of market data, including Trades, Bids, Offers, and Indicative Prices.

Following normalization, the dataset is aggregated and the mean value is calculated. Any data points lying outside the range defined by Mean + Standard Deviation (upper limit) and Mean – Standard Deviation (lower limit) are excluded to preserve the accuracy and integrity of price discovery.

As a general guideline, where a data point falls marginally outside the defined upper or lower limit—by no more than 1%—and is otherwise considered credible and representative of prevailing market conditions, the analyst may manually include such data in the price computation. The inclusion of such data points is subject to appropriate justification and internal validation.

Beyond the above relaxation, this methodology is applied uniformly, and executed trades may be excluded where they

are identified as statistical outliers. However, analysts may adjust outlier data following consultation with the manager. Any such adjustments must be clearly justified and fully documented, with the rationale demonstrating how the modification improves the accuracy and reliability of the final assessment.

### 3.7 Rationalization

Rationalization in price assessment refers to the process of adjusting and refining market data to ensure it accurately reflects the true value of a commodity.

BigMint determines the final price using a weighted approach, which begins with the application of standard deviation to remove outliers. The remaining market data is then used for the final computation.

Market data is divided into two main categories: Transaction (T1), which includes Transaction Prices, and Non-Transaction (T2), which encompasses Offers, Bids, and Most Tradable Prices. For each category, a single price is calculated by averaging the available data within that category.

For Transaction Prices (T1), when sufficient volume data is available, a weighted average is used. In the absence of volume data, a simple average is applied. If the data includes both volume-based and non-volume data, individual prices are calculated for each type using the appropriate average method and then combined to determine the aggregated price.

The final price is determined by assigning equal weights (50%) to the single prices from both the Transaction (T1) and Non-Transaction (T2) categories. The two prices are

then combined to compute the final assessment.

In the event that data under the T1 category is excluded due to outlier detection, and no remaining data is available within this category for final computation, the entire weight of 100% shall be assigned to the T2 category for determining the final price.

Exceptions to these guidelines apply to assessments based on price revisions for a company or auction-based price assessments.

### 3.8 Guidelines for exercise of judgement

In the context of price assessment, judgment refers to the professional evaluation and decision-making performed by the analyst when market data alone is not sufficient, clear, or consistent enough to determine the final assessment.

Judgment is used, in a controlled and transparent manner, and only when necessary to ensure that the published price accurately reflects prevailing market value. Analyst judgment may be applied under the following circumstances:

- **Thin market liquidity:** When few or no transactions are available and supplemental market indicators must be relied upon.
- **Lack of executable inputs:** When firm bids, offers, or trades are unavailable and alternative credible indicators are required.
- **Conflicting data inputs:** When reported values diverge materially and require assessment of reliability and representativeness.
- **Data concentration risk:** When a single submitter accounts for a significant proportion of inputs, necessitating checks to avoid undue influence.
- **Interpolation or extrapolation:** When deriving values for intermediate grades, locations, or time periods using established market relationships.

- **Normalization of non-standard data:** When adjustments are required for differences in specifications, delivery terms, or timing.
- **Outlier treatment:** When system-identified outliers may be included or excluded based on market drivers, prevailing conditions, and data credibility.
- **Final price adjustment:** When a system-generated average requires rounding or limited adjustment to better reflect prevailing market value.

### 3.8.1 Ensuring consistency in judgment

Consistency in the exercise of judgment is essential for maintaining transparency and reliability in market assessments. This is ensured through standardized guidelines, structured processes, and comprehensive training.

Analysts receive regular training supported by detailed internal guides that outline situations where judgment may be required and provide clear, standardized approaches for applying it. In addition, all assessments undergo critical review, with managerial oversight and monitoring to ensure that any use of judgment is well-supported, transparent, and aligned with established methodology.

## 3.9 Criteria for assessment

This section outlines the key criteria that must be met for a price assessment to be published, ensuring that it is based on sufficient and reliable market information.

### 3.9.1 Guidelines for data inclusion

To ensure that only reliable and representative information contributes to a price assessment, the following guidelines are applied when including market data for price computation.

- Data must be submitted by verified sources within the collection window
- Data must meet all specification requirements, with normalization applied where necessary
- Data must reflect independent and non-speculative transactions
- Data must provide sufficient detail for verification & be consistent with market conditions

### 3.9.2 Market threshold data

Threshold data refers to the minimum amount of market data required for an accurate price assessment.

While we do not impose strict minimum data requirements, we are dedicated to providing reliable value assessments for all markets, whether liquidity is high or low.

To maintain the integrity of our assessments, we aim to collect at least five (5) market data points for each assessment to arrive at a reliable final price. While there is no maximum limit on the number of data points, we focus on capturing all pertinent information available during the collection period. However, the minimum required number of data-points may vary in markets with fewer participants or during periods of exceptionally low liquidity.

### 3.9.3 When threshold is not met

In liquid markets with ample market data, the available information is validated, organized according to a defined hierarchy, and processed using the established methodology to determine the final price. However, if market volatility is unusually high, the analyst may adjust the assessment for better accuracy and decide whether an out-of-schedule assessment is needed.

However, during illiquid market conditions, when trading activity is low and there are fewer transactions or active participants, there is often a lack of sufficient and reliable market data to accurately assess prices. Such conditions can arise due to factors such as holidays, political unrest, or natural calamities that disrupt normal market activity, leaving participants without clear direction.

In cases where the disruption is caused by a market closure, we may either roll over the previous prices and publish them on the portal or hold the assessment until conditions improve.

If the market is open but activity is low, the analyst will publish a representative price, referred to as 'price under review.' This price is determined by gathering inputs from market participants to identify the most tradable levels. Once market conditions stabilize, the price will be reassessed using the standard price computation process. Any decision made to address such market distortions will be communicated to clients via circulars or announcements.

### 3.9.4 Significant proportion of input data

All verified data within the assessment window is considered for price computation. However, when data from a single market participant contributes more than 50% of total valid submissions, it is treated as a significant proportion and triggers an enhanced review.

In such cases, additional scrutiny beyond the standard verification process is applied, including cross-checking with historical submissions, to ensure the accuracy and representativeness of the data.

If the data is credible and aligns with broader market conditions, it is included in the assessment with appropriate documentation. If inconsistencies or anomalies are identified, the analyst escalates the matter for supervisory review and may classify the data as an outlier, with clear justification for its exclusion.

### 3.10 Assessment checks & approvals

After following the various computation procedures, the final prices for the assessment are published only after approval from the relevant authority.

We have adopted the maker-checker concept for assessment checks, where assessments carried out by Analysts (makers) are reviewed, verified, and approved by a Manager (checker). Physical records of approval, post-validation, are maintained on a daily basis.

If the relevant manager is absent, the GM/AGM will conduct the inspection and sign for approval.

### 3.11 Data dissemination

Once approved, the final assessed prices, post-rationalization, are rounded to an appropriate level based on prevailing market conventions and typical trading margins.

The rounded prices are then published on the website and mobile apps according to a predefined schedule, ensuring users have consistent and predictable access to the information.

#### 3.11.1 Publication schedule

BigMint publishes its price assessments daily, weekly, biweekly and monthly. The publication times for all products are clearly defined in the BigMint assessment specification guide, aligned with periods of higher market activity and liquidity.

Publication times are generally adhered to, but a flexibility window of up to 30 minutes before or after the scheduled publication time may be applied, based on specific market conditions or unforeseen circumstances.

For assessments that are published more than once within a single trading day, interim intraday publications are indicative in nature and are derived using analyst judgement based on the limited market information available at the respective publication times.

The final publication of the day is computed strictly in accordance with the standard assessment methodology and incorporates the complete set of eligible market data collected throughout the entire assessment window. This final published price represents the formal and auditable benchmark assessment for the day.

In special cases, such as price revisions for a company or auction-based assessments, there is no fixed publication time. In these cases, assessments are conducted based on the availability of data.

Price assessments are conducted on working days, with the exception of public holidays when the office is closed. If an assessment is scheduled on a public holiday, it will be carried out on the previous/next working business day. Clients will be notified of any changes to the publication time through circulars or announcements.

Similarly, a circular will be issued for assessments conducted out of schedule in the event of significant market volatility.

Publication schedules may also be adjusted due to unforeseen events such as network or power failures, disruptions, or internal decisions. In such cases, BigMint endeavors to provide advance notice of any changes to stakeholders.

#### 3.11.2 Delay in price reporting

A delay in price reporting is considered material if it exceeds 30 minutes after the scheduled publication time.

If delays in price reporting are anticipated, the responsible department must notify clients promptly with clear and concise communication. This communication should include the reason for the delay, an estimated timeline for resolution, and details of any interim measures being implemented.

Analysts must take expedite efforts to resolve the cause of the delay and restore timely price reporting.

In the event of a late publication, standard practice dictates that only data received within the designated collection window will be included in the price computation. Any market data received after this window will be excluded from the calculation.

A post-delay analysis will be conducted to identify the root cause of the delay, and appropriate measures will be implemented to prevent future occurrences.

#### 3.11.3 Corrections & clarifications

BigMint will issue corrections to assessments if errors occur due to data entry mistakes or unintentional omissions that lead to a material change in price during the price computation process.

However, prices will remain unchanged if new transaction or bids/offers emerge after the data collection window has closed.

Corrections will also be applied to prices marked as 'price under review', which are published as representative prices in cases of market distortion.

These prices will be revised and adjusted according to the standard computation process once market conditions stabilize.

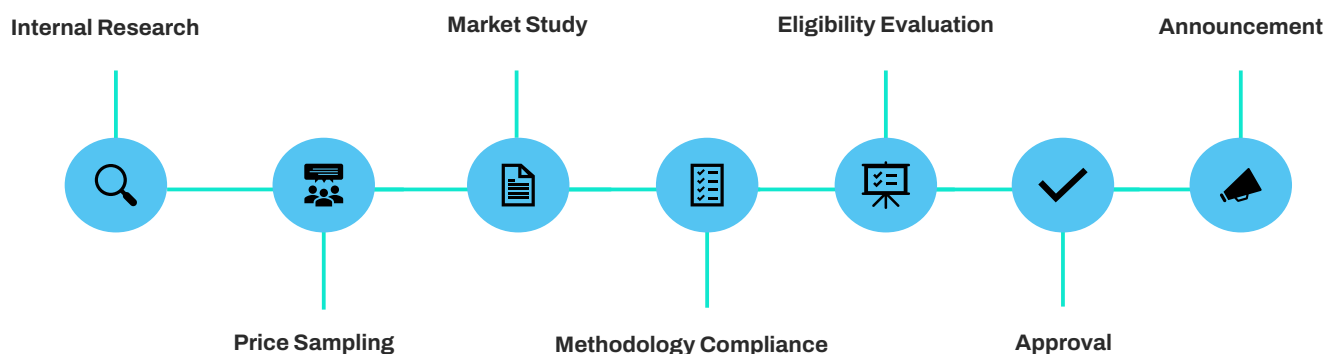

### 3.12 New price launch procedure

BigMint introduces new price assessments for commodities based on internal research and client requirements, following a defined procedure prior to implementation.

For new price assessments, the relevant department conducts a beta version price sampling to confirm that the commodity

price is suitable for reporting.

A comprehensive market survey is also carried out and completed as per the standard format, covering product specifications, methodology checklists, and other critical aspects required to ensure compliance, accuracy, and audit readiness.

The concerned department also reviews the assessment's eligibility through a self-evaluation process. Once this review is completed and approved, an announcement is made to relevant stakeholders regarding the launch of the new price assessment, and a pricing notice is issued on the day the assessment is onboarded.

### 3.13 Cessation of assessment

BigMint may consider discontinuing an assessment under circumstances where it is unable to produce quality benchmark assessments according to the defined methodology.

Factors leading to this decision may include the emergence of competing assessment methods, concerns over the quality, rigor, and validity of the assessments, as well as external factors such as regulatory changes or market dynamics.

In such cases, BigMint will issue a notification regarding the cessation of the assessment, specifying whether it is permanent or temporary, along with the reasons. This notification will be displayed on the announcement page.

### 3.14 Complaints handling procedures

Complaints and feedback are managed by the Support

Desk in accordance with the Query Management System (QMS).

The support handles all types of complaints, suggestions, feedback, and other related inputs submitted by subscribers or clients.

To ensure proper resolution, these inputs must be submitted in writing through approved channels—either via Freshdesk chat, email to the support, or a formal business letter addressed to the corporate office. Submission received through any other medium will not be considered.

The support differentiates between routine inquiries and formal complaints and provides resolution in accordance with the defined procedures.

Routine inquiries include general queries, feedback, suggestions, and other concerns related to price assessments as well as matters related to supporting business functions such as data services, IT, and marketing.

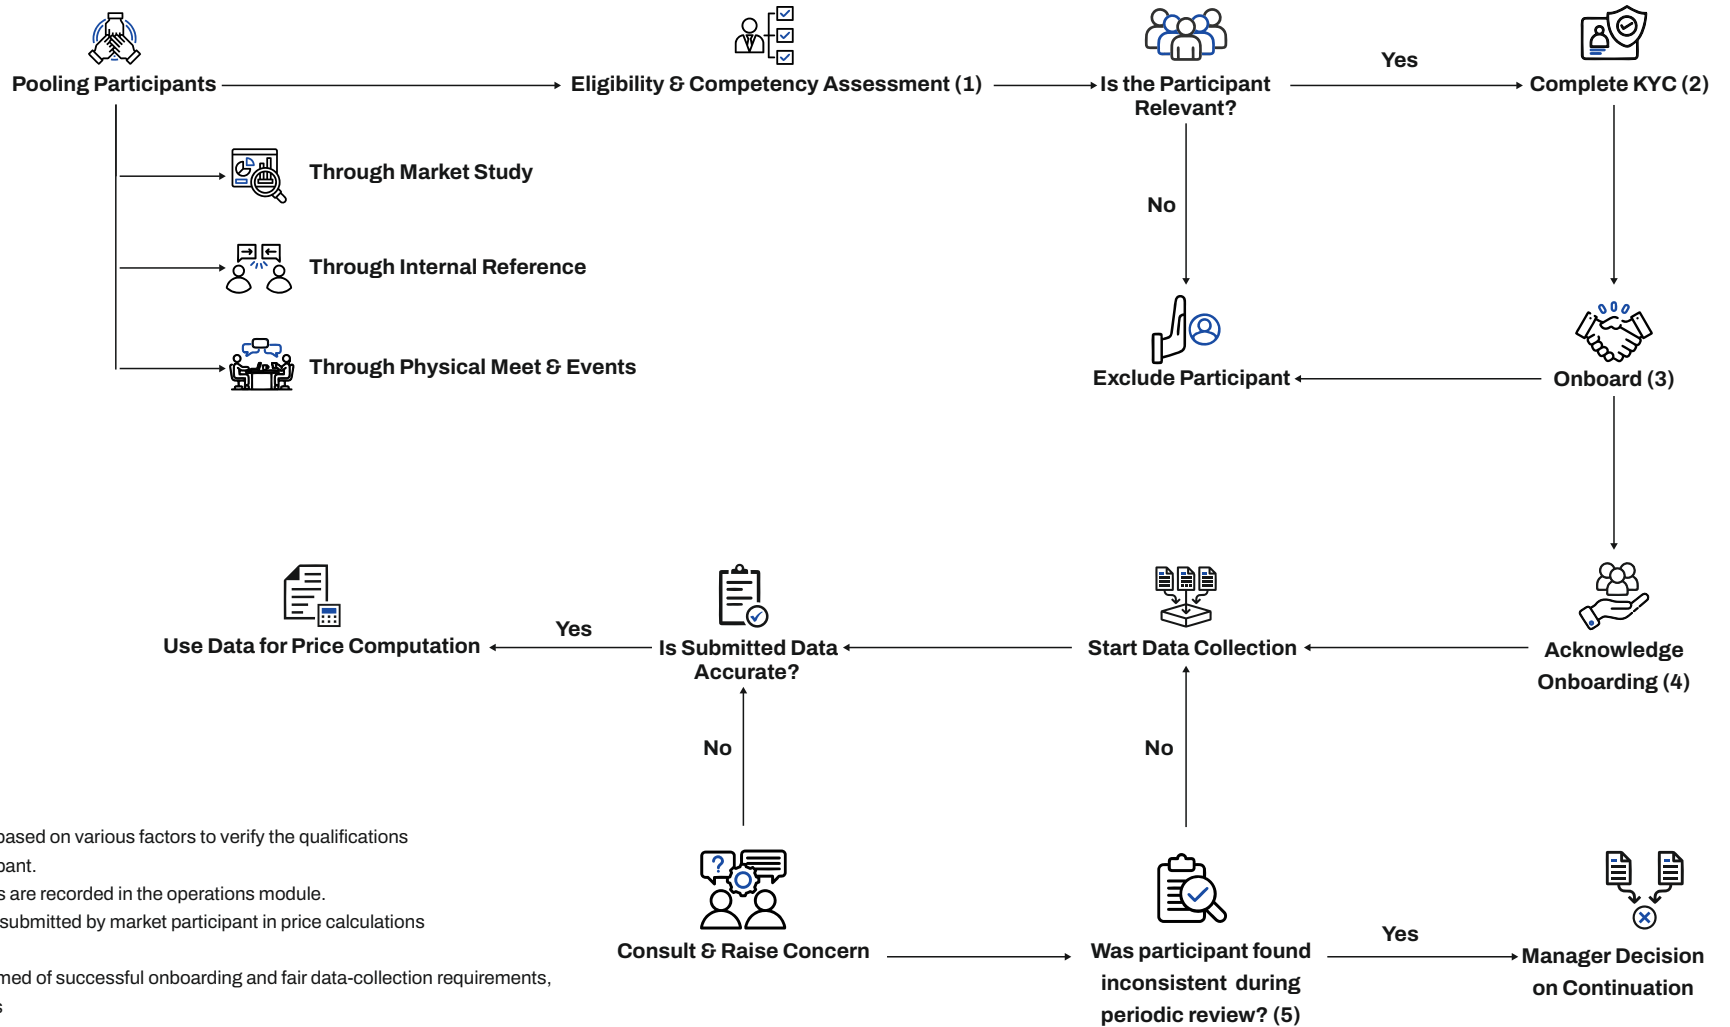

Upon receipt, each submission is logged and routed to the relevant department for action, with progress monitored to ensure closure within the prescribed timelines.

If a query remains unresolved within the stipulated period, it is escalated as per the defined escalation mechanism.

Formal complaints alleging misconduct, policy breaches, or violations of the Code of Conduct—and which cannot be resolved through routine interaction—are referred to the Internal Complaints Committee (ICC) for independent review and resolution in line with internal policies.

## 4. Flow Chart

### 4.1 Market participant onboarding

(1) Process involves screening based on various factors to verify the qualifications and market standing of a participant.

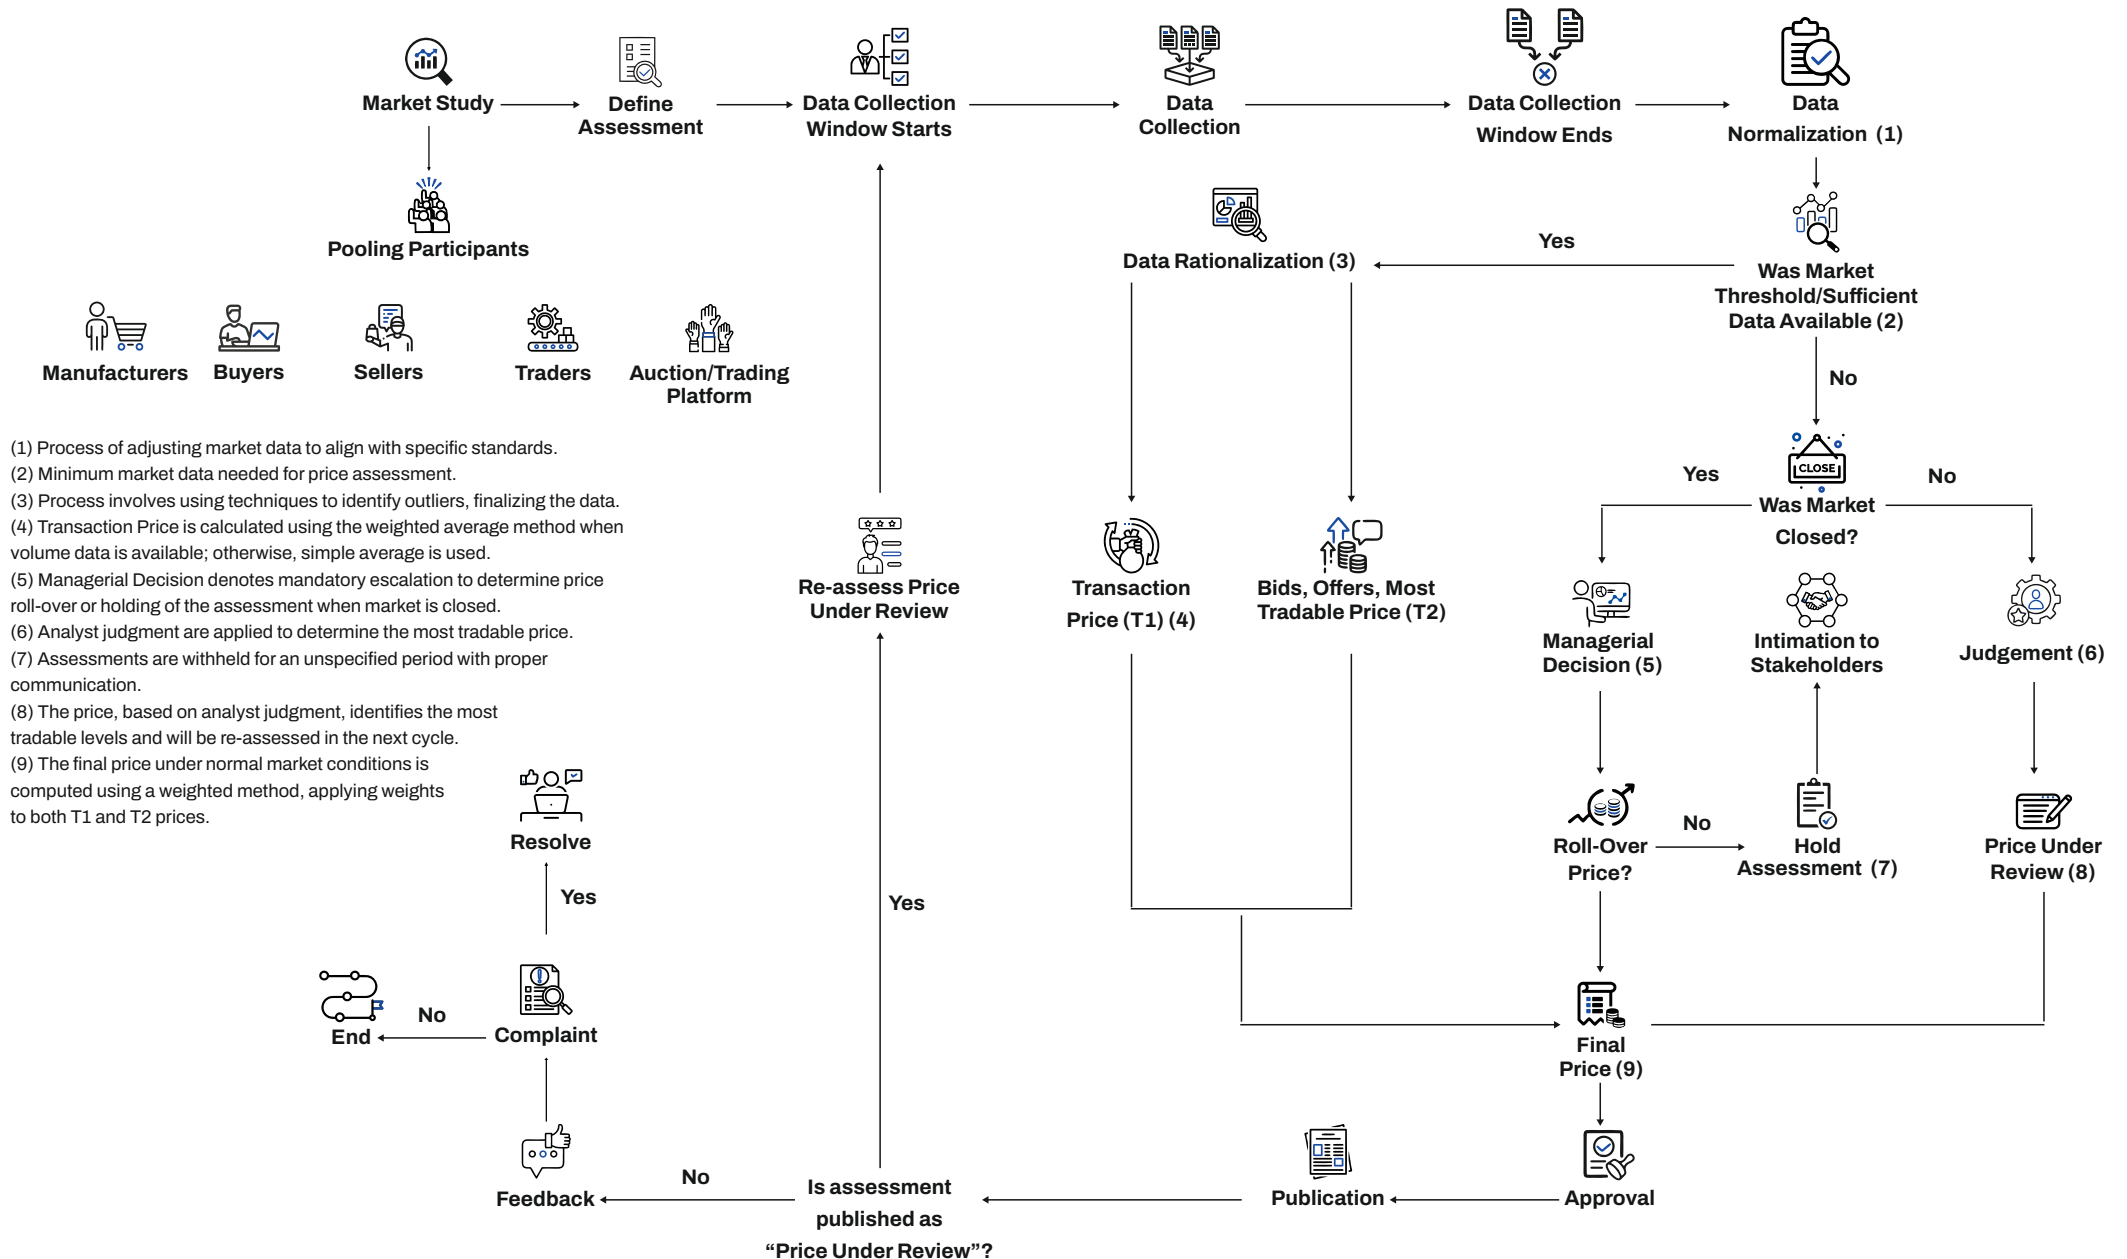

(2) Details of market participants are recorded in the operations module.

(3) This marks inclusion of data submitted by market participant in price calculations and news publishing.

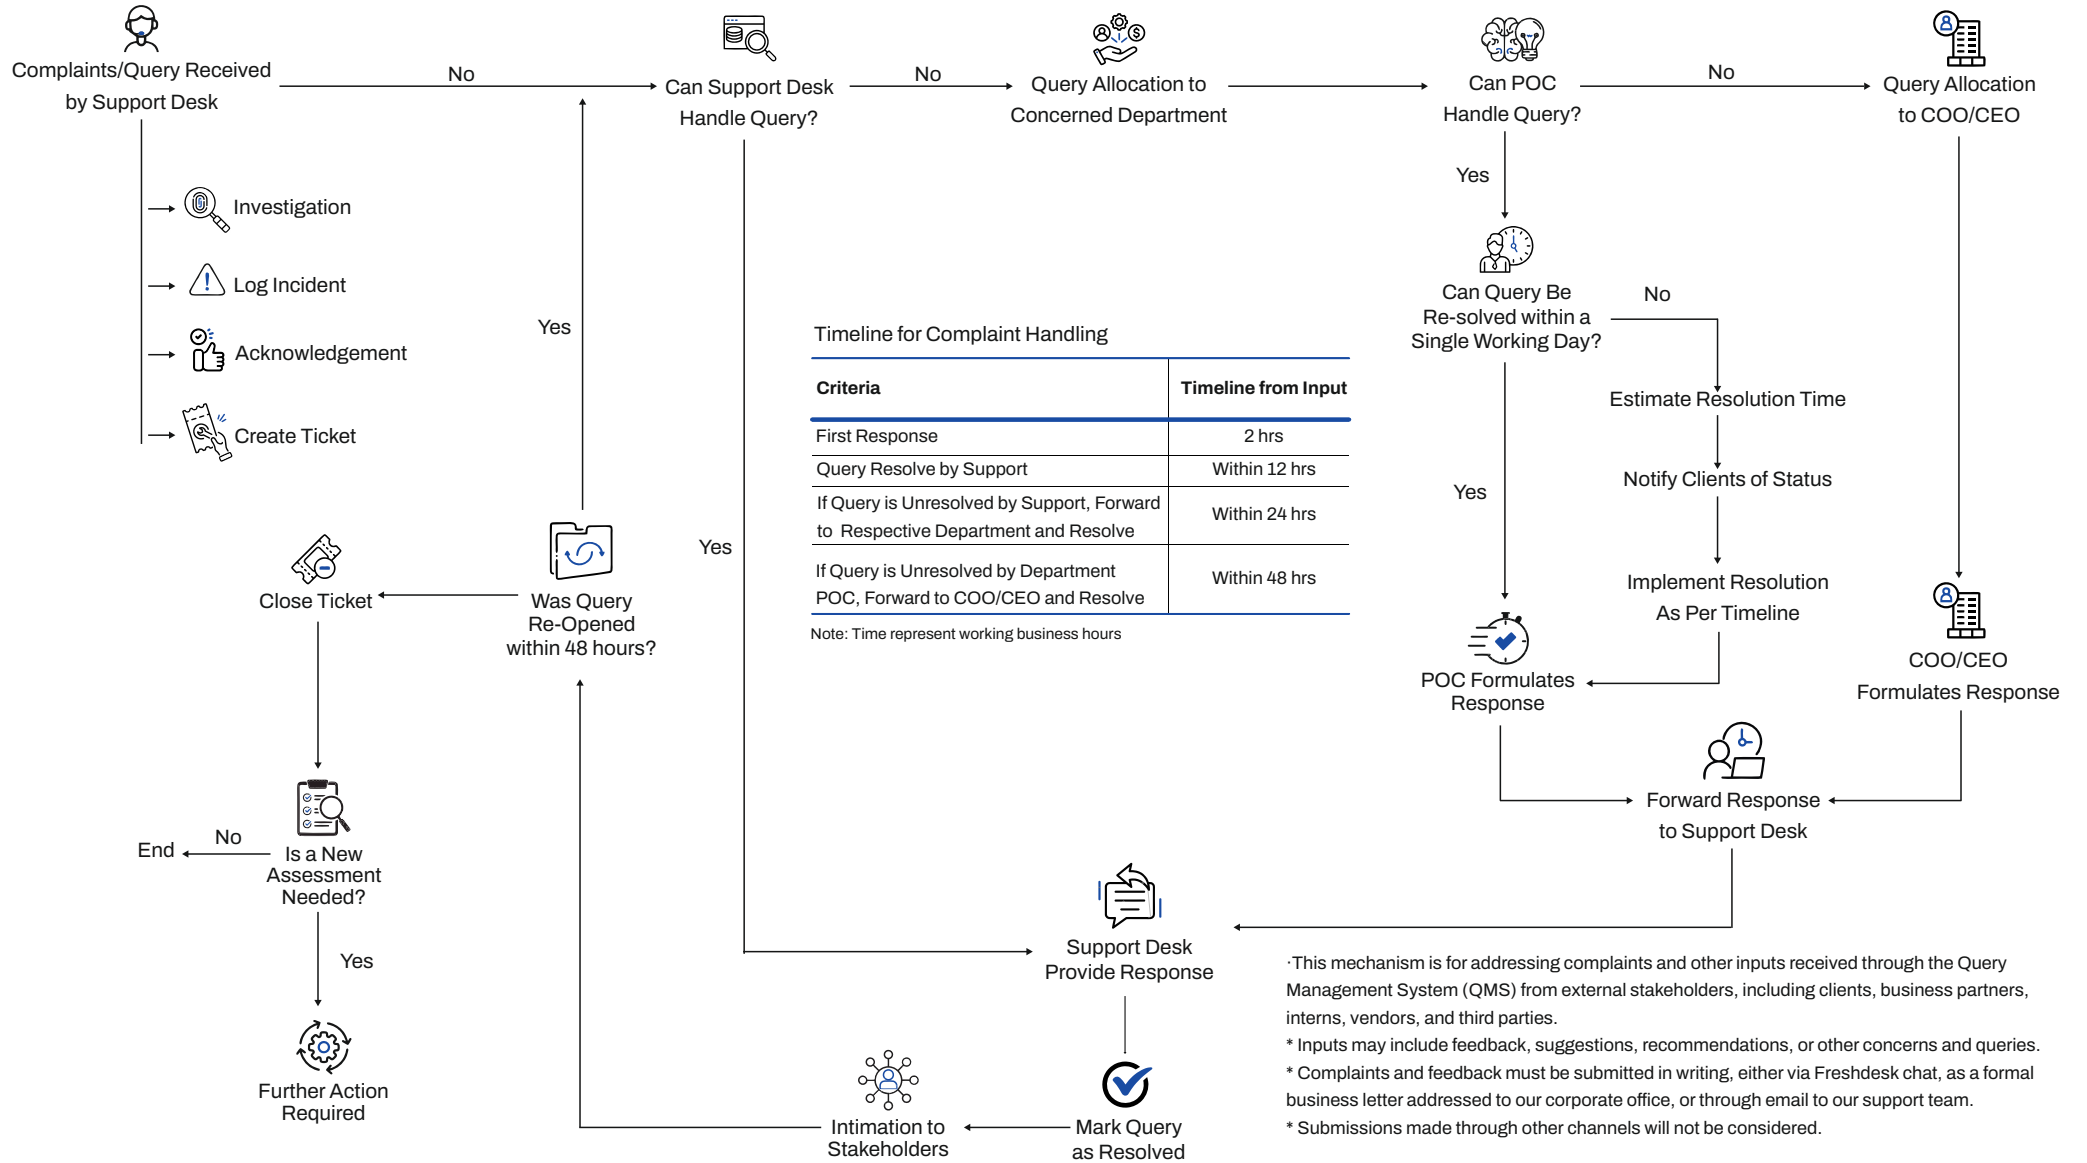

(4) Market participants are informed of successful onboarding and fair data-collection requirements, in line with established practices

(5) Periodic reviews are conducted based on participant rankings to ensure the reliability of data used in price assessments.

## 4.2 Price assessment mechanism

### 4.3 Complaint handling procedure

This mechanism is for addressing complaints and other inputs received through the Query Management System (QMS) from external stakeholders, including clients, business partners, interns, vendors, and third parties.

- \* Inputs may include feedback, suggestions, recommendations, or other concerns and queries.
- \* Complaints and feedback must be submitted in writing, either via Freshdesk chat, as a formal business letter addressed to our corporate office, or through email to our support team.
- \* Submissions made through other channels will not be considered.

## 5. Adherence to IOSCO Principles

In addition to the core assessment methodology, BigMint adheres to a comprehensive set of governance and oversight principles aligned with IOSCO's global standards for PRAs. These principles ensure that assessments are transparent, robust, independent, and consistently applied.

### 5.1 Ensuring consistency & continuity

BigMint ensures consistent and reliable price assessments through well-defined guidelines, standardized workflows, and integrated IT systems applied uniformly across all commodities.

All market analysts undergo regular training, structured competency assessments, and cross-market exposure to ensure a common understanding and consistent application of the methodology.

Consistency is further supported by strong managerial oversight, periodic reviews, and system-driven processes that standardize each stage of the assessment process—from data collection to final publication, including adherence to defined publication schedules.

To maintain continuity, BigMint follows a strong succession planning framework. Every active assessment has a designated secondary analyst to ensure uninterrupted coverage, supported by backup arrangements at the managerial level. Annual manpower and capability reviews help identify skill gaps and strengthen preparedness and overall operational continuity.

### 5.2 Quality & integrity monitoring

BigMint upholds the quality and integrity of price assessments through a disciplined and transparent evaluation framework. All market inputs undergo rigorous

verification, normalization, and data quality checks, supported by clearly documented processes and strong governance controls.

Quality is reinforced through multi-layered checks, including cross-validation of data, review of outliers, managerial approvals and clear documentation of analyst judgements.

The IT Module strengthens data governance by systematically tracking all inputs, assessment decisions, rationalizations, and performing automated calculations, ensuring accuracy & transparency throughout the assessment process.

To maintain integrity and independence, all assessments are produced free from influence, with strict controls around price computation, conflict-of-interest management, and role-based system access.

Analysts independently determine price computation through a structured, process-driven approach, with managerial oversight to confirm that assessments are not affected by any actual or potential commercial or personal relationships. Continuous market monitoring and periodic methodology reviews ensure that our assessments remain current, relevant, and reflective of actual market conditions.

### 5.3 Code of conduct

The Code of Conduct outlines the core principles and guidelines that govern our business practices, ensuring integrity, transparency, and independence across all activities. It serves as a practical reference for analysts, helping them uphold the highest ethical standards and safeguard the credibility of price assessments.

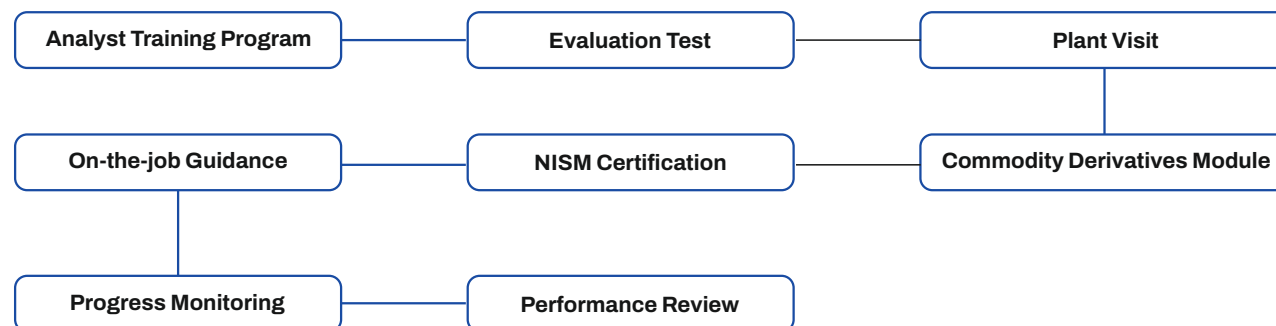

BigMint has also established a formal whistleblower mechanism that enables employees to confidentially report any misconduct or breaches of the Code.

### 5.4 Analyst training & supervision

BigMint has established a comprehensive framework to ensure that analysts responsible for price assessments possess strong domain expertise and methodological proficiency.

Upon joining, each analyst undergoes a structured 60-day training program under 'Shivir module' covering market fundamentals, pricing methodology, and key technical and commercial concepts, followed by mandatory module-specific assessments to confirm readiness.

To gain practical exposure, analysts participate in plant visits to understand production processes, plant environment, and operational practices, thereby acquiring hands-on technical knowledge.

Analysts also complete mandatory modules on commodities and derivatives to develop the expertise required for accurate market evaluation and are responsible for successfully obtaining the NISM certification for commodity derivatives to validate compliance and market knowledge.

Following induction, analysts receive focused on-the-job guidance, including supervised participation in market calls, practical exposure to IT systems, and application of prescribed methodologies and procedures.

Progress is closely monitored through managerial oversight and periodic competency reviews that evaluate adaptability, data quality, analytical accuracy, and adherence to internal standards. Any gaps are addressed through targeted development actions, including mentoring or additional learning interventions, to ensure continuous capability enhancement.

### 5.5 Conflict of interests

We have identified potential risks that could lead to conflicts of interest in price assessments and have established robust controls to mitigate them. To maintain transparency, all assessors, managers, and employees must disclose any external affiliations that could give rise to conflicts of interest.

Analysts receive regular training on internal policies governing gifts, use of confidential data, personal trading, and any activity that could lead to market manipulation, ensuring that personal interests or external relationships do not influence PRA activities. They are also required to submit declarations reaffirming their commitment to ethical market conduct.

At an organisational level, system access is strictly role-based, ensuring that analysts can only view and update data relevant to their assigned commodities, thereby safeguarding data integrity and preventing unauthorized modifications.

Ongoing reviews and awareness initiatives further reinforce accountability and support impartial, independent, and compliant price assessments.

### 5.6 Data security

We ensure the security of price assessment data by storing it on licensed, secure servers and enforcing strict access controls. All sensitive information is encrypted both in transit and at rest to prevent unauthorized access.

Employees receive regular training to strengthen their awareness of security best practices, including recognizing phishing attempts, managing passwords securely, and following company policies for handling confidential information.

### 5.7 Audit trails

Audit trails are maintained through timely documentation and retention of all relevant information and decisions made during the price assessment process. This includes records of data collection, exclusions, application of judgment, and the final price, with all information securely stored for a defined retention period.

These audit trails ensure transparency, support accountability, and facilitate inquiries by market authorities, thereby upholding the integrity of the price assessment process.

### 5.8 Periodic audits

Internal audits are conducted by the compliance team to assess the effectiveness, accuracy, and integrity of our processes. In addition, an independent external auditor with the necessary expertise is appointed annually to review and report on the organization's adherence to its methodology and compliance with the IOSCO Principles.

## 6. Methodology Review

BigMint conducts regular reviews of its pricing methodology to ensure it remains robust, accurate, and aligned with market developments. This is achieved through a combination of internal and external reviews.

### 6.1 Internal review

An internal review of the methodology is conducted at least annually, or earlier if significant market developments, relevant regulatory changes, or client feedback necessitate a review.

The procedure involves evaluating the methodology, identifying areas requiring revision, and implementing the necessary changes, including updates to the assessment-wise specification details. The revised draft is then circulated to relevant internal stakeholders for feedback, and appropriate updates are incorporated.

### 6.2 External review

Following the internal review, an external consultation is conducted whenever material changes are proposed. Market participants, clients, and other stakeholders are invited to provide feedback during a defined consultation period (one week).

All comments received are carefully evaluated, and the proposal is refined accordingly. Decisions and final updates are made public unless confidentiality is requested by a stakeholder, after which the revised methodology is submitted for final approval by senior management.

In addition to these scheduled reviews, stakeholders may submit suggestions or comments at any time via the support desk. These submissions are considered according to BigMint's complaint-handling and governance procedures and, where relevant, are referred for internal reviews to determine whether methodology updates are required.

### 6.3 Methodology revision

After completing the internal and external review processes, the proposed updates to the methodology are submitted for formal approval. Senior management evaluates the revised methodology, including feedback from stakeholders, to ensure it meets organizational standards, regulatory requirements, and industry best practices.

Once approved, the methodology is formally documented, and the final version is communicated to all relevant stakeholders for implementation.

### 6.4 Revision history

Version	Revised On	Section	Section Details	Type of Change	Nature of Change
1.0	May-25	All	Complete Document	Original Issue	Initial issuance of pricing methodology
2.0	Feb-26	3.2.1	Data Collection: Who can report	Addition	Formalized market participant identification and onboarding
		3.2.3	Data collection: What to report	Deletion	Requirement of enrolling 2–3 participants to ensure data continuity
				Addition	Guideline for deriving assessment values from submitted price ranges
				Modification	Revision of market participant review to periodic frequency with ranking-based evaluation
		3.3	Data collection window	Addition	Permitted use of verified data received before defined publication timing
		3.6	Outliers & exclusions	Addition	Defined limited tolerance inclusion and clarified exclusion of trade deals
		3.8	Guidelines for exercise of judgement	Addition	Defined situations where analyst judgement may be exercised
		3.9.1	Guidelines for data inclusion	Addition	Defined criteria for inclusion of market data
		3.11	Data dissemination	Addition	Included rounding of final assessed prices based on market conventions
		3.12	New price launch procedure	Addition	Included flow chart for price launch procedure
		3.14	Complaints handling procedures	Modification	Defined procedure for handling formal complaints through ICC
		5.4	Analyst training & supervision	Addition	Included requirement of NISM certification & process flow chart for training
7	Price assessment specification guide	Modification	Revised collection window & publication timings of global ferrous scrap assessments
